GLOBAL SUPERSTORE

Week 2 Data Analytics Report | Sales and Profit Performance, 2011–2014

1. Project Overview

This report summarizes an analysis of the Global Superstore dataset using Power BI. The dashboard presents key performance indicators, sales trends, sales by country and market, customer-segment contribution, and profit performance by region and sub-category.

2. Key Performance Indicators

Metric	Dashboard result
Total Sales	12,642,501.91 (12.64M)
Total Profit	1,467,457.29 (1.47M)
Total Orders	Approximately 25K
Average Sales	246.49
Profit Margin	11.61%

3. Key Findings

Sales increased over time. Sales rose from approximately 2.26M in 2011 to around 4.30M in 2014.

Technology led category sales. Technology generated approximately 4.74M in sales, ahead of Furniture and Office Supplies.

Consumer customers contributed the largest share. Consumer sales were approximately 6.51M (51.48%), followed by Corporate at 3.82M (30.25%) and Home Office at 2.31M (18.27%).

Profitability varied by sub-category. Copiers generated approximately 258,567.55 in profit and Phones approximately 216,717.01. Tables showed negative profit.

Regional profit performance varied. The Profit by Region visual shows different profit levels across regions, so performance should be investigated at a more detailed level.

Sales are distributed across multiple markets. The dashboard compares APAC, EU, US, LATAM, EMEA, Africa and Canada, with a Country slicer for further exploration.

4. Business Risks

Losses in Tables. Continued negative profit may reduce overall profitability. Investigate pricing, discounting, product costs and shipping costs before changing investment.

Sales growth may not equal profit growth. Sales alone do not show whether products or markets are profitable; monitor profit and margin as well.

Uneven market performance. Overall totals can hide local differences, so use country and market filters to explore performance.

5. Business Opportunities

Build on Technology performance. Investigate demand, stock availability and margins to identify sustainable growth opportunities.

Evaluate profitable sub-categories. Copiers and Phones contribute strong profits; review demand and margins before increasing investment.

Use country and market comparisons. Explore country-level and market-level results to identify where further investigation or targeted action may be worthwhile.

6. Business Recommendations

Investigate Tables before reducing investment. Review discount levels, selling prices, product costs and shipping costs, then decide whether to reprice, renegotiate costs or reduce the range.

Prioritise evidence-led Technology opportunities. Review profitability and demand, including Copiers and Phones, before increasing stock or promotional spend.

Track profit alongside sales. Use total profit and profit margin when evaluating products, markets and time periods.

Use country and market comparisons to target action. Explore the dashboard by country and market; validate filter-specific figures before making market-specific claims.

Monitor performance over time. Review sales and profit trends periodically to see whether growth is accompanied by sustainable profitability.

7. Limitations

This report is based on the figures and visuals visible in the supplied dashboard export. The PDF does not expose every underlying row or filter-specific result. It therefore avoids asserting unverified country-level or Africa-specific totals and does not claim that observed patterns prove a particular cause. Check market-specific figures directly in Power BI before publishing them.

8. Conclusion

Global Superstore recorded approximately 12.64M in sales and 1.47M in profit, with an overall profit margin of 11.61%. Technology led category sales, Consumer customers contributed the largest share of revenue, and profitability varied across sub-categories. Management should investigate the losses in Tables, evaluate opportunities in profitable products, and use market-level analysis alongside profit measures to guide decisions.
